Preface

The world of international broadcasting surrounds us all the time, with the air filled with tens of thousands of radio signals from every corner of our planet. With a short wave radio, it is possible to tune in to any of them - Moscow, Beijing, Washington, Delhi and so on.

This latest edition of the *International Radio Stations Guide* offers a useful map to the short wave radio spectrum, containing details of which station is where on the dial, a trip through the broadcasts in English of the main international radio broadcasters, and useful data including a world time chart and some handy translations for listeners to use when writing to foreign radio stations.

Listening to far off radio signals (or DXing, as it is known to many hobbyists worldwide) is a great pastime, whether you spend twenty minutes or twenty hours in front of your set this latest edition of the *International Radio Stations Guide* will prove an invaluable companion as you journey around the globe.

Good listening!

Section 1

LISTENING TO SHORT WAVE RADIO

It is unlikely that many people in the developed world give a second thought to the world of short wave radio, and yet all around us, throughout the day and night, radio signals from all around the planet are sent from hundreds of radio stations in dozens of languages.

For people living in western Europe and North America, radio tends to be something which one has on in the background as one gets up in the morning and gets ready to leave for work, or as an accompaniment for driving. Research by broadcasters shows that radio audiences decline steadily from their early morning peak to a very low figure in the evening when television takes over providing entertainment. It has also been shown that radios mostly stay tuned to one station, with listeners reluctant to move the dial in case they cannot find their favourite radio station again. Broadcasts on VHF-FM are most popular, offering high quality stereo music with modern technology ensuring excellent reception in most areas.

But to leave a radio receiver tuned to one station is to miss out on so much. It is perhaps like limiting ones reading to a single author. Whilst we all expect news to be brought to us from around the world by our local radio and television stations, few people consider the possibility of tuning in to the radio stations of countries where the news is being made.

In some parts of the world, people listen to overseas radio broadcasts as a matter of course. In Africa, South America, China and the Soviet Union, national broadcasting uses short wave radio. This is because signals transmitted on medium wave and VHF-FM have only limited coverage, and to broadcast throughout the whole of a sparsely populated country the size of Zaire, for example, a more cost effective means of broadcasting is required. Short wave radio fills this need, since signals travel in a different way to those on VHF-FM or medium and long waves. Meanwhile, broadcasts from other countries offer a lifeline of news free from the censorship which affects domestic broadcasting in many countries.

If one turns on a short wave radio receiver and tunes along the broadcast bands, it is possible to hear broadcasts from every continent in a multiplicity of languages including for example English, Chinese, Spanish, Arabic, Farsi, Indonesian and Korean. There has been international broadcasting since the beginning of radio. But in the last few decades its popularity has waned in Europe and North America because of the explosion of home grown broadcasting, both sound and vision, and the improvement in quality which has resulted in stereo sound and the added enhancement through the transmission of music recorded on compact disc and R-DAT digital audio tape. In Britain,

whilst youngsters may tune in to Radio Luxembourg which broadcasts in English during the evening, few will explore their radio dials further to discover that Radio Moscow, Radio Tirana, Belgium Radio and others are on offer.

How Radio Signals Travel

All radio waves travel at the speed of light, 300 million metres a second. Not all radio waves behave in the same way, however. Short wave, or high frequency, radio signals make use of a part of the earth's atmosphere which has been ionised by the ultra violet and soft X-rays emitted by the sun and is known as the ionosphere. A transmitted signal travels up to the ionosphere where it is effectively bounced back to earth. A short wave signal is able to travel many thousands of kilometres by bouncing off the earth and the ionosphere several times. Signals from Australia routinely reach northern Europe, and vice-versa.

But several factors affect how well short wave signals can travel. Higher short wave frequencies travel during the day, whilst during the night, lower frequencies work best. And the ionosphere changes in relation to the number of sun spots. The sun has a cycle, with periods of high solar activity, and therefore the greatest number of sun spots, occurring each 11 years. Currently we are benefitting from reasonably high sun spot numbers, and therefore higher short wave broadcast frequencies, such as those in the 25 MHz, or 13 metre band, can be used by broadcasters and will travel tremendous distances. At the times when sun spot numbers are low, higher frequencies are all but useless for radio broadcasting.

To ensure good reception in the area to which a broadcaster is transmitting, engineers use several frequencies in a number of parts of the short wave broadcast bands. Listeners are encouraged to try each frequency that is being transmitted to find which works best. And listeners should remember that unlike on medium wave or VHF-FM, one frequency will not work for all of the day!

What Is On The Air?

The choice for the listener is immense, with a multiplicity of programmes from many stations to choose from. The peak listening times are at local dawn and mid-evening when stations vie for your attention.

The principal players in international broadcasting are the BBC World Service, which has a twenty-four hour a day English service and highly respected news on the hour; Radio Australia, in English twenty-four hours a day with news on the hour and the Pacific as the main target area; Radio Moscow World Service, again on the air twenty-four hours, and with news on the hour (although of a different type to that of the BBC); Radio France International, with a French world service on twenty-four hours a day and English bulletins

regularly through the day; and the Voice of America which is on the air for most of the day, but directed to specific regions.

There are many smaller stations which are on the air for much less time, but nonetheless have large followings – Radio Netherlands, Swiss Radio International, the Christian Science Monitor from the United States (a relative newcomer to international radio, but now operating twenty-four hours a day and with four transmitting sites in the United States and the Pacific) and Deutsche Welle from Germany.

Details of the English schedules of all of these stations are included in the *International Radio Stations Guide*.

Short wave radio offers a unique way of following international news stories. At the time of the crumbling of the eastern European frontiers, listening to the late (although perhaps not lamented) Radio Berlin International gave some indication of the situation within that country. When Kuwait was being invaded in August 1990, the short wave services from Kuwait City provided dramatic listening, whilst Radio Baghdad offered an insight into the mind of President Saddam Hussein. Regional international stations in the Soviet Union have enabled listeners in the west to keep in touch with the pro-democracy movements even when Moscow was barring foreign journalists from Vilnius and the other Baltic state capitals.

And the BBC Monitoring service in England keeps a well tuned ear to the world's airwaves to report what domestic and international radio stations are broadcasting. From a mansion above the town of Reading, teams of language monitors have flashed news around the world within moments of its broadcast: the ending of Prague Spring, Chernobyl, the invasion of Kuwait, military clampdowns in the Soviet Asian republics – and all of which short wave listeners with a good radio receiver have been able to listen to as well.

There is much that can be written about international radio, but there is no substitute for tuning around the short wave bands and discovering for oneself what is there.

The Short Wave Broadcast Bands

Broadcasting is not the sole user of the short wave radio spectrum. There are many other forms of communication, including the military, maritime mobile, aviation, news agencies, radio amateurs and others. The short wave frequency range (3 to 30 MHz) has been divided by World Administrative Radio Conferences in order to meet the requirements of all users. The broadcast bands are the most crowded of the short wave spectrum, and although there are certain areas designated for radio broadcasting, many stations now operate on frequencies outside these official areas to avoid the overcrowding. In 1979, a World Administrative Radio Conference voted to increase the range of frequencies for broadcasting, but subsequent Conferences have not sanctioned their use pending some form of planning and

effective regulation of broadcasting on short wave. However, the extensions are used almost as heavily as the official frequency ranges. A further World Administrative Radio Conference (or WARC) will take place in February 1992 and may well agree to further extensions, although when they will be released is another matter.

The table below indicates the currently sanctioned bands, and the extensions agreed in WARC 1979. Listeners will find that many stations, such as the BBC, Voice of America, Radio Beijing and so on operate outside these bands in order to ensure that their programmes can be heard by their audiences around the world.

<i>Frequencies in kilohertz (kHz)</i>	<i>Agreed extensions (at WARC 1979)</i>	<i>Metre Bands</i>
2 300– 2 495		120 metre band
3 200– 3 400		90 metre band
3 900– 4 000		75 metre band
4 750– 5 060		60 metre band
5 950– 6 200		49 metre band
7 100– 7 300		41 metre band
9 500– 9 775	9 780– 9 900	31 metre band
11 700–11 975	11 950–12 050	25 metre band
13 600–13 800		21 metre band
15 100–15 450	15 455–15 600	19 metre band
17 700–17 900	17 550–17 895	16 metre band
21 450–21 750	21 755–21 850	13 metre band
25 600–26 100	25 670–26 100	11 metre band

[WARC 1979 agreed that the 11 metre band should be reduced in range]

The 120, 90 and 60 metre bands are allocated to tropical domestic broadcasting where the effectiveness of medium wave broadcasting is severely impaired as a result of high atmospheric noise levels.

Section 2

CHOOSING A SHORT WAVE RADIO RECEIVER

There is a staggeringly wide range of radio equipment available in the developed world, but little of it offers short wave frequencies. In the most part, short wave radio is an unknown quantity for radio shop staff. Large retail chains may offer a limited selection of short wave receivers, but will not have much expertise in listening, or knowing what makes one set better than another.

It is essential to set a budget for a new receiver. Prices range from around £40 in the United Kingdom, through to well in excess of £2,000 for a top of the range communications receiver. The majority of short wave listeners are likely to look at sets costing up to, say, £200, and there is a good choice available from the main makers of short wave sets. It is better to buy a dedicated short wave set, rather than a multipurpose radio which may have a cassette player built in. Here are some suggestions for what to look for in a new short wave receiver:

Frequency coverage

Short wave frequencies range from 3 to 30 megahertz (3 000 to 30 000 kilohertz) and a good set will cover as many of those as possible. Many modern radios offer continuous coverage, and this is to be recommended to enable listeners to tune in to frequencies outside the official broadcast bands (detailed in Chapter One) which many stations use to escape the worst overcrowding. Some sets will offer a range of short wave frequency bands, which cover the main bands, with some frequencies either side. Check to see whether main BBC World Service frequencies such as 9 410 or 12 095 kHz are included in the range.

Frequency display

It is helpful for a set to give an accurate indication of the frequency it is tuned to. Analogue displays (where a needle moves along the frequencies printed on a dial) are most common, but are not always accurate. More sets are being provided with a digital display of the frequency, either in kilohertz or megahertz. This enables easy identification of a station using frequency lists in the *IRSG*.

Tuning

Radios are usually tuned by a rotary knob which causes the frequency to be moved up or down the bands. There may be a selector switch to enable a different short wave range to be chosen if the set has divided the short wave spectrum into different bands. More common amongst radios with a digital display is a keypad which enables frequencies to be entered directly. Manual tuning in sets with a keypad is generally

possible using a rotary tuning knob, or by arrow keys which increase or decrease the frequency in the same manner as a rotary knob.

Other facilities

Radio receivers which are digitally tuned (in other words with a keypad) usually offer a number of memories into which regularly used frequencies may be stored. This eliminates the need to remember a large number of separate frequencies, and allows almost instantaneous tuning.

Make sure that your set has a socket for the connection of headphones or an ear piece. It is often more comfortable to listen to short wave broadcasts through headsets since interference can make listening difficult through a loudspeaker.

Ensure that there is a connection for a tape recorder if you think that you might want to record programmes in the future.

An external aerial socket is highly useful.

Some sets offer single side band [ssb] reception. This is a form of transmission used by radio amateurs, and by broadcast stations for feeding relay stations. Few stations use ssb for mainstream broadcasts, but they may be required to by future World Administrative Radio Conferences.

Short Wave on the Move

Many of the short wave radio sets made today are designed for travelling, and so are small (around the size of a paperback book) and light weight. The benefit of frequency memories and digital tuning are obvious for frequent travellers. Bear in mind the size of the set you are looking at if you travel a great deal.

Short wave radio is available in the car, although the choice of receivers is limited. Three European manufacturers make car radio/cassette players with short wave : Blaupunkt, Grundig and Philips.

Several of the DX programmes broadcast by international radio stations carry reviews of new equipment — details are included in this book. The main manufacturers of short wave radios are Grundig, Panasonic, Philips, Sangean and Sony. All offer a range of receivers with a wide variety of different features.

Improving Reception

The most important part of a radio is the aerial, and yet most people rely solely on the telescopic antenna provided with the set. The advice however is to use an outdoor aerial if at all possible. The most rudimentary aerial will generally improve reception greatly. Invest in a piece of copper wire (insulated if possible) and sling it between the house and a convenient tree in the garden, and connect it to the radio. Make sure that the copper wire does not touch any building or tree as this will cause the incoming signal to earth. Also ensure that it does not

pass near any exposed electrical cables. More complicated aerials will help to overcome any particular local interference problems, or to pull in signals from a particular direction.

If you are not able to use an outdoor aerial, keep your set next to a window or an outside wall, and away from televisions or electrical motors which may cause very heavy electrical interference.

Section 3

HOW TO USE THE IRSG

This latest edition of the *International Radio Stations Guide* offers the casual listener and the professional radio monitor an essential reference work to enable him to steer around the changing face of the radio dial. The *IRSG* has been totally revised and rewritten, including a great deal of new information. It offers a comprehensive guide to international radio on short wave, as well as up-to-the-minute data on European and North American medium wave and long wave services.

The *International Radio Stations Guide* contains a complete listing of all the short wave spectrum, in the officially designated broadcast bands, and in the adjacent frequency ranges. The information contained in the main short wave section has been compiled from registrations lodged with the International Frequency Registration Board [IFRB] in Geneva, coupled with extensive monitoring research carried out in the United Kingdom and overseas.

For the first time this year's *IRSG* denotes whether a user has registered (denoted R) with the IFRB or has been observed (denoted O) as occupying a frequency.

For example :

7 110 POL Warsaw 60 R Polonia R

shows that Poland has registered a 60kW transmitter at Warsaw for Radio Polonia broadcasts, whilst

9 410 G Daventry 100/300BBC O

shows that this frequency has been observed to carry BBC World Service from either a 100 or 300 kW transmitter at Daventry.

In some cases, registrations with the IFRB tally exactly with actual usage, but in others there is no use of the channel by the broadcaster shown according to monitoring. However, including both registrations actually used, and those not monitored, enables the *IRSG* to be as up-to-date as possible, as some registrations may be brought in to operation at a later date.

The table of English broadcasts in the *IRSG* shows times for winter, but some stations will alter their transmission times in the spring to take account of local clock changes. If the broadcast listed cannot be traced at the time shown, try an hour either side. Alterations to times and frequencies are generally given at the opening of transmissions.

The country shown is that where the transmitter is located, but if another country is shown following [eg HKG/G or CHN/E] this shows that a programme from another international broadcaster is being carried as part of a relay agreement – in the cases shown the BBC from its Hong Kong relay, and Radio Exterior de Espana from Chinese

transmitters. An increasing number of relay arrangements have come in to operation during 1990, with agreement between Radios Moscow and Beijing to transmit from each other's territory.

Feeder channels have been included as they have been observed. Some broadcasters still use feeders despite the advent of satellite links, particularly when satellite services fail or no ground station is available. Frequencies change regularly.

The indications for usage of Soviet frequencies is generally shown as either domestic, external or domestic/external. The transmission network within the Soviet Union is extremely complex, and many frequencies switch between domestic programmes, such as the Mayak service, and external transmissions. Regional Soviet Republican services may also be heard.

The main Moscow radio services:

First which is a general programme covering the entire country with five time shifted versions;

Second or **Mayak** which is a musical entertainment network, similar to Britain's **BBC Radio Two** with news casts every thirty minutes;

Third which is an arts and music channel with five time shifted versions for national coverage.

In addition to the national networks, each Soviet Republic has its own **Republican First Programme** which alternates between the Moscow First programme, Russian language programmes and broadcasts in the Republic's own language. Some Republics have a second programme in the local language.

Identification of the service is usually straightforward, with an announcement of "Govorit Moscow" or the name of the city or republic from which it is being broadcast. "Radiostanza" is an alternative. More Republics seem to be introducing English language international services as the Soviet Union slides further towards break up. Those monitored at the time of compilation are included in the Broadcasts in English section of the *IRSG*.

It should be noted that the Soviet Union benefits from having three country codes (and therefore three votes on the International Telecommunication Union) – URS for the Soviet Union, UKR for the Ukraine and BLR for Byelorussia. The US state of Alaska is classified separately from the United States as ALS. A complete listing of country codes is included in the *IRSG*.

It is likely that there will be many changes to international short wave radio broadcasting during 1991. Radio Kuwait will probably return to the air following the cessation of hostilities in the Gulf, but Radio Budapest may be severely cut back during the summer. Radio Canada International's future is also uncertain, as a result of budgetary problems. More relay agreements are likely to be signed and new transmitters and sites will come in to use. These will be included in the next revision of the *International Radio Stations Guide* which will probably be published in 1992/1993.

Radio Australia

Radio Australia broadcasts principally to Asia and the Pacific, but is audible throughout the rest of the world at various times of the day. The English service has been listed in frequency order, with times of the operation of each channel shown alongside, and it is suggested that listeners try all frequencies to find the strongest signal.

Frequency [kHz]	Time
21 825	0900-1000, 1100-1230
21 775	0100-1430
21 740	0030-0330, 2200-2400

Voice of America

The English service of the Voice of America operates for most of the day, but is not directed to all parts of the world at all times. We have included the service in to three principal regions and list frequencies and times of operation to those parts of the world.

Time	Frequency [kHz]
To Europe, North Africa and the Middle East	
0100-0300	21 550, 17 740, 15 160, 7 205
0400-0500	5 995
0400-0600	9 715, 7 200
0400-0700	7 170, 6 140
0500-0600	9 670, 9 700
0500-0700	15 205, 11 750, 6 060, 5 995
0600-0700	11 805, 7 325, 6 095
400-1700	15 205
1500-2100	9 700
1700-2200	15 205, 9 760, 6 040
1900-2200	11 710
2100-2200	11 960, 9 700
To Africa	
0300-0430	11 835, 6 145
0300-0700	17 715, 15 350, 9 575, 6 035
0600-0700	9 530, 6 125
1600-2000	11 920, 9 575
1600-2200	21 625, 17 800, 15 580, 15 410
2000-2100	9 570
2000-2200	21 485
To Asia	
0000-0100	17 820, 17 735, 15 290, 15 185, 11 760, 9 770, 7 120
0100-0300	21 550, 21 545, 17 740, 17 735, 15 250, 15 160, 11 705, 7 205, 7 115
1000-1200	11 720, 5 985
1000-1500	15 425
1100-1400	15 155
1100-1700	9 760
1200-1300	11 715
1300-1800	6 110
1400-1500	15 160
1400-1800	15 395, 9 645, 7 125
1900-2000	15 180, 11 870, 9 525
2100-2200	11 870
2100-2400	17 735, 15 185
2200-2400	17 820, 15 305, 15 290, 11 760, 9 770, 7 120

Radio Moscow World Service

This is not the complete schedule for Radio Moscow's English services. The frequency usage of the station is extremely complex, with up to forty frequencies on the air at any one time carrying Radio Moscow World Service. Some transmitters switch at the half-hour to foreign language broadcasts, or to carry Soviet domestic services.

At the beginning of 1991, Radio Moscow dropped all its regional English services which had until then run in parallel with a separate World Service stream. Only the West Coast of North America service between 0400 and 0800 gmt remains.

Time	Frequency [kHz]
0000-0300	21 790, 21 690, 17 890, 17 825, 17 700, 17 665, 17 655, 17 570, 15 425, 12 050, 12 045, 11 980, 11 755, 9 715, 9 685, 7 150, 6 060, 4 895
0300-0800	21 790, 21 690, 21 635, 17 890, 17 825, 17 700, 17 675, 17 655, 17 590, 15 420, 15 295, 15 140, 7 310
0800-1300	21 725, 21 680, 21 635, 21 450, 17 810, 17 790, 17 710, 17 665, 17 655, 17 625, 17 605, 17 570, 15 550, 15 520, 15 465, 15 345, 15 280, 13 705, 11 920, 11 705
1300-1600	17 810, 17 790, 17 780, 17 670, 17 665, 15 345, 13 705, 11 705, 9 705
1600-1900	9 830, 9 795, 7 315, 7 235, 7 170
1900-2000	15 475, 15 470, 11 775, 11 630, 9 875, 9 830, 9 765, 9 685, 7 170, 7 130, 7 105, 6 065, 6 030
2000-2100	15 470, 12 060, 12 020, 11 685, 9 895, 9 860, 9 830, 9 820, 9 795, 9 780, 9 765, 9 720, 9 685, 9 620, 7 170, 7 105, 6 175, 6 030, 5 950
2100-2400	12 050, 9 870, 9 790, 9 765, 9 685, 7 150

Section 12

PROGRAMMES FOR DXERS AND SHORT WAVE LISTENERS

Many international radio broadcasters produce regular programmes for short wave listeners and DXers. A number of the programmes also include news about computers, and developments in all forms of electronic communications (including space).

We have included a selection of the more popular programmes in this section, but it is by no means exhaustive. Frequencies for the programmes can be found in the Broadcasts in English section of the book.

Radio Australia: COMMUNICATOR

Transmitted on Sunday at 1430, Monday at 0730 and Friday at 0430 and 1000, this half-hour programme includes media news and listening tips concentrated, mainly on the Pacific region, but of interest to a world-wide audience.

BBC World Service: WAVEGUIDE

News about developments in BBC World Service, advice for better listening, satellite information and regular reviews of new equipment for the short wave broadcast listener. Produced by Gary Stevens and Tom Walters, and heard on Saturday at 0905, Monday at 0530, Tuesday at 1115 and Thursday at 0130.

Radio Canada International: SHORT WAVE LISTENERS' DIGEST

Hosted by Ian McFarland, this weekly programme is heard on Sundays in the European service of Radio Canada International at 2235, and at 0035, 1835 and 2335 in other services. There are regular equipment reviews by Larry Magne, and listening tips, with a North American orientation, from Glenn Hauser.

HCJB Quito Ecuador: DX PARTY LINE

Heard at 0730, 1030 and 2130 on Saturday and 0030, 0230 and 0500 on Sunday, the DX Party Line often concentrates on one subject each week, including reviews of individual stations, equipment news or listening tips.

Radio Kiev

Sunday at 2145 and Monday at 0045.

Radio Moscow

Heard on Thursday at 2000.

Radio Netherlands: MEDIA NETWORK

A weekly magazine of world-wide communications and media news, with regular reviews of new equipment, reports on major short wave events around the world, and listening tips each week concentrating on a different part of the world. Produced and presented by Jonathan Marks, the programme is heard on Thursdays at 0751, 0851, 1051, 1151, 1451, 1651, 1851, 2051 and Fridays 0051, 0351.

Radio New Zealand International: MAILBOX

DX tips from Arthur Cushen are heard on the 1st and 3rd Monday of the month in the Mailbox programme at 0430, with a repeat on the 1st and 3rd Friday at 1905.

Radio Exterior de Espana: DX PROGRAMME

Frequency news and listening tips, produced by REE's DX Editor Ambrosio Wang An-Po. Heard on Saturdays at 1938 and 2138, and on Sundays at 0037, 0137 and 0533.

Radio Sweden: SWEDEN CALLING DXers

The world's oldest short wave news programme, produced by George Wood, and heard on the 1st and 3rd Tuesday of the month in each English programme from 1230 through to 0330 on Wednesday. The programme includes listening tips from throughout the world, together with satellite, computer and media news.

Swiss Radio International: SWISS SW MERRY-GO-ROUND

Presented by Bob Thomann and Bob Zanotti (known as the "two Bobs") and heard each Saturday around 15 minutes into each transmission. The programme features answers to listeners' technical queries and problems, as well as news about international radio.

Voice of America: COMMUNICATIONS WORLD

Produced and presented by Gene Reich, the programme features news about the electronic media in North America, together with technical features and news from the international broadcasting world. Heard at 1210, 1710 and 2110 on Saturday, and at 0110 on Sunday.

WRNO: WORLD OF RADIO

With Glenn Hauser and his listening tips. Heard on Thursday 0130 and 1630, Friday 0000 and 0130, Saturday 0400, Sunday 0030 and 2130. The programme will be heard one hour earlier during the summer months in North America.

Radio Vilnius

Mondays at 2250 and 2320.

Section 15

WAVELENGTH/FREQUENCY CONVERSION

$$\text{Wavelength in Metres} = \frac{300,000}{\text{Frequency in kHz}} \quad (\text{a})$$

$$\text{Wavelength in Metres} = \frac{300}{\text{Frequency in MHz}} \quad (\text{b})$$

$$\text{Frequency in kHz} = \frac{300,000}{\text{Wavelength in Metres}} \quad (\text{c})$$

$$\text{Frequency in MHz} = \frac{300}{\text{Wavelength in Metres}} \quad (\text{d})$$

Examples:

- No.1 Convert 180kHz to Wavelength in Metres.
Using formula-(a)

$$\text{Wavelength} = \frac{300,000}{180} = 1667 \text{ metres}$$

- No.2 Convert 91MHz to Wavelength in Metres.
Using formula-(b)

$$\text{Wavelength} = \frac{300}{91} = 3.3 \text{ metres}$$

- No.3 Convert a wavelength of 1500 Metres to Frequency.
Using formula-(c)

$$\text{Frequency} = \frac{300,000}{1500} = 200 \text{ kHz}$$

- No.4 Convert a wavelength of 4 Metres to Frequency.
Using formula-(d)

$$\text{Frequency} = \frac{300}{4} = 75 \text{ MHz}$$

PLEASE NOTE

Babani books should be available from all good Booksellers, Radio Component Dealers and Mail Order Companies.

However, should you experience difficulty in obtaining any title in your area, then please write directly to the publisher enclosing payment to cover the cost of the book plus adequate postage.

If you would like a complete catalogue of our entire range of Radio, Electronics and Computer Books then please send a Stamped Addressed Envelope to:

International Radio Stations Guide

Provides the casual listener, amateur radio DXer and the professional radio monitor with an essential reference work designed to guide him or her around the ever more complex radio bands.

This new edition has been totally revised and rewritten and incorporates much more information which is divided into the following sections:-

- Section 1 : Listening to Short Wave Radio
