Another plea on behalf of AMSAT-UK

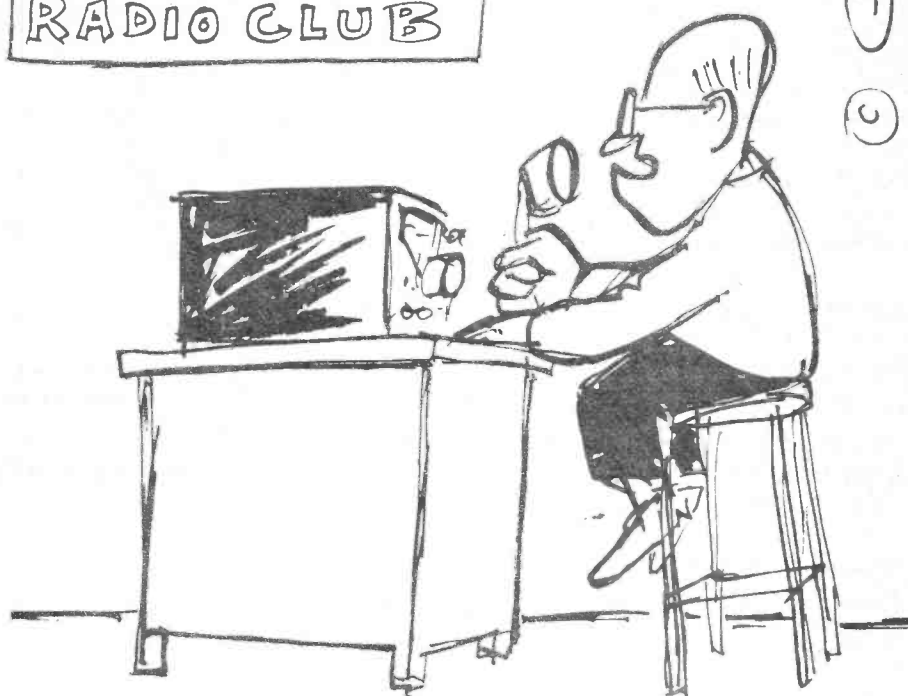

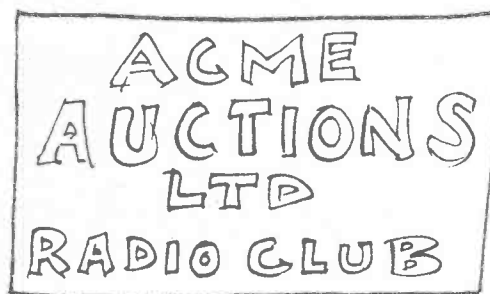

Now that UOSAT, and Phase-3 satellites are active, *please do not use* the frequency spectrum above 145.800MHz for FM contacts. 145.825 is slap on one beacon frequency for a start, and there are a lot of people out there collecting data from it. There is now little excuse for using the satellite allocation for other purposes — there is an awful lot of 2 metres available for straightforward chatting on other modes.

You will probably know that the Phase III satellite *Oscar 10* is up and has been in action. There was

some damage due to a slight accident with the propulsion stage of the rocket, but it doesn't seem to have caused too much aggro. If you want more info on this and UOSAT, then the man to contact is Ron Broadbent, G3AAJ, 94 Herongate Road, Wanstead Park, London E12 5EQ. An SAE *must* be enclosed. Initially you will receive an application form for membership plus other info. AMSAT-UK depends on donations and lots of voluntary help for all its good work. The minimum donation is £6.00 per year, but Ron will smile 'broadbently' if he receives more.

Oscar News is the newsletter of AMSAT-UK — this has progressed from a few sheets of duplicated paper, to a very professional 36-page printed A5 booklet. It contains lots of info, and is worth the £6.00 a year alone. There are also a number of nets, on both HF and VHF, where you can hear the latest info and get your questions answered by the experts.

As time progresses, satellites are likely to play an increasingly important role in our hobby — now is the time to get in on the act.
